Installing Pushee-Ri Products

After you have downloaded the files (a .zip file and maybe some other files), I recommend that you make a backup copy of the files and save them in another folder or on a USB stick or something similar. I also recommend opening the download directory in a (new) file explorer window, because later you will need to copy some files from this folder to another folder.

Installation can be done in two ways: using DIM - the "Daz Install Manager" - or manually.

Installing with DIM

1 : Open the DIM application, find the gear icon ⚙ in the **upper right corner** and click on it.

2 : Select "Basic Settings ..." in the pop-up menu.

3 : The "Basic Settings" dialog box appears, where you can see several paths used by DIM. You will need the "Package Archive" as this is the folder where DIM temporarily stores the files to be installed. Click the path next to "Package Archive" to open the directory in a new File Explorer window.

4 : Now **copy** the .zip file from the download window and **paste** it into the DIM file explorer window ("Package Archive") you just opened. Use the "Copy and Paste" method instead of moving the files, because DIM "gobbles" files that are in the "Package Archive" folder.

   Keep in mind: Do not unzip the .zip file, but copy the zip container as it is.

5 : Switch to the "Ready to Install" tab of the DIM. If the product you want to install is not displayed, click the "Refresh" icon ♻ (two curved arrows in the upper right corner).

6 : On the "Ready to Install" tab, select the product you want to install and click the "Start Queue" button in the lower left corner. The product will now be installed.

Manual installation (PC)

1 : Unzip the .zip file to a **temporary folder**, switch to that folder and keep its File Explorer window open. Expand the "Content" folder (this will be the first folder that shows up) with a double click.

   Keep in mind: Do not unzip the .zip file directly into your DAZ product folder as this will cause errors. Always (!) unzip the file to a temporary directory for manual

installation.

2 : Locate the "My DAZ 3D Library" folder and open it. The easiest way is to open the DAZ Studio application, select the "My DAZ 3D Library" entry, right-click on it and choose "Browse to Folder Location ..." from the context menu.

> **Tipp:** If you want to install the package to the "My Library" folder instead of the "My DAZ 3D Library" folder, you can use the technique described above. Simply select the "My Library" entry and invoke the context menu.

3 : A new File Explorer window will open showing the contents of the "My DAZ 3D Library" directory. If you compare the .zip folder with the library folder, you will notice that some directories are the same ("data", "Runtime", "People"). These directories will be merged in step 4.

4 : Switch to the File Explorer window that displays the unzipped .zip file. Select and **copy** the **all(!)** shown folders like "data", "Documentation", "People", "Runtime" etc.

Now switch to the File Explorer window where your DAZ library is displayed and **paste** the folders you just copied.

Close the DAZ Studio application and start it again. The product is now installed.
